Feature development for **SimplyWiki 1.1** has been completed and it is now ready for beta testing! SimplyWiki has developed over the past few months, continuing on from Wiwimod, which was last released as a XOOPSÂ module in 2005. This release includes the first new set of features for the module since that time. SimplyWiki (Wiwimod 0.83+) was released in November 2008 and only addressed existing functionality. This version of SimplyWiki is compatible with XOOPS 2.0.x and 2.3.x, and ImpressCMS 1.0 and 1.1. Known issues are problems with PDF generation of special characters - that will be addressed in the next release with the use of an updated PDF class.

Some of the basic features available since SimplyWiki 1.0 - You can name the install directory anyÂ name you'd like (wiki, faqs, wiwimod, etc)   It will work with WYSIWYG editors you have installed   It supports multiple languages, even right-to-left languages   Notifications for page additions and changes   Support for tags, using the Tag module **SimplyWiki 1.1 Change Log**

Added New data fields: creator, create date, views, last viewed, revisions (count), summary, allow comments   Update function to migrate data to new tables   Functions to update new fields - visited (Gibaphp)   Revision summary can be entered for each page revision   Summary information to RecentChanges rendering, also available in History view   'Add New Page' field to easily create new pages - user must have write privileges for the form to display   Config option to enable/disable Quick Add   Configuration option to select the top page for the module   Configuration option to select which page information to display   CAPTCHA added to edit form and config option to enable/disable - borrowed code from imLinks (mcdonald3072)   New block: Page List - options to list by create date, modified date, last viewed date or number of revisions, different display modes and customizable date format   New block: Add Page - can be placed anywhere on your site to add a new wiki page. Block only displays if the user has write privileges in the wiki   New blocks: Tag Cloud and Top Tags (can only be used if the Tag module is installed) **Fixed** Blocksadmin: Edit block now saves options in ImpressCMS 1.1+ (thanks mcdonald3072)   Missing) in Spanish language file   Missing) in French language file   Corrections/additions in Dutch language file **Improved** DB structure: split wiwimod table into wiki_pages and wiki_revisions. Overall DB size is reduced while the amount of information is increased   Code layout of the parser - thanks to work found in 0.8.9 beta release (Gizmhail/Xavier/others)   Size of body field increased to mediumtext, allowing for larger pages (up to 16,777,215 characters, less if multibyte characters are used)   All language constants now reflect SimplyWiki naming   Added page title as 2nd sort field for TOC   Added rel='nofollow' to PDF link to prevent searchbots from indexing the PDF versions of the page   Visibility in blocksadmin - based on imLinks (thanks mcdonald3072)   Added 'can_clone' property to all blocks **Links to download packages -**
