The ImpressCMSÂ Project (www.impresscms.org) has released an updated version of their community management system - version 1.2.6. This was a minor update, addressing an issue with the included content module and TinyMCE WYSIWYG editor. This update also is fully compatible when being run on MySQL 5.2 or higher. This will most likely be the last release in the 1.2 series for ImpressCMS, as the next release, [version 1.3 is nearing its final stages](#).

What's changed in this release

An invalid default value for a database field was causing the installation of the Content module to fail. Dates for new content pages were defaulting to 31 Dec 1969 without any way to change it. Installation of the core on MySQL 5.2, or higher, failed because of the TYPE= statements in the sql structure. TinyMCE was updated and it should work now on Internet Explorer (IE) 9. The complete list of changes can be found on [the changelog on trac](#). Â **Where to get the updated version** You can get the latest download from the [ImpressCMSÂ SourceForge repository](#), including complete installation packages and upgrades from early versions and an incremental upgrade from ImpressCMSÂ 1.2.5.
